Catering and Inventory Management

Company Name	Betopia Limited	Date	April 2026
Project Name	Catering and Inventory Management	Created By	Product Team

Executive Summary

The Catering and Inventory Management System is a web-based platform designed for organizational environment. It digitizes and streamlines the full canteen operation within a single unified system.

The platform connects three core roles: **Users** (who browse, order, and pay), **Kitchen Staff** (who fulfill and manage orders), and **Admins** (who oversee operations, users, inventory, and finances). It eliminates manual processes, reduces food waste through inventory awareness, and gives management real-time visibility into daily canteen activity.

Problem Statement

Currently, catering operations are managed through entirely physical, paper-based processes or partial physical and partial digital process. Moreover, there is a lack of centralization. Orders are taken manually, payments are collected in cash with no formal recording system, and inventory is tracked through physical registers at the counter.

The absence of a centralized record means that reviewing daily sales, cash collected, or stock consumed requires manually sifting through paper logs. End-of-month operational reviews, which should be quick summaries, become significant administrative tasks simply because the data must be compiled by hand. On the inventory side, items run out mid-service with no prior warning.

A centralized digital platform would preserve the operational reliability the team maintains, while eliminating the blind spots and administrative burden that come with doing it by hand.

Business Objectives

The primary objective is to build a reliable, role-based catering management platform that digitizes and streamlines the full catering workflow from on-demand meal ordering and cash transaction recording to real-time inventory tracking within a single unified system.

Key business goals include:

1. Eliminating paper-based order and transaction records by centralizing all catering operations into one digital platform.
2. Reducing the time spent on end-of-day and end-of-month operational reviews by maintaining automatic, real-time records of

- all orders and stock usage.
3. Ensuring full inventory accountability by tracking stock levels on a per-portion basis and automatically reflecting the depletion.
 4. Enabling role-based access for Admins, Kitchen Staff, and Users so that each party operates efficiently within their defined scope without overlap or confusion.

Business Model

Revenue Model

Tier	Target Client	Billing	Key Features
Starter	Small offices (≤50 users)	Monthly subscription	Core ordering, basic inventory, 3 admin seats
Professional	Mid-size institutions (51–200 users)	Monthly / Annual	Full feature set, reporting, unlimited staff
Enterprise	Large organizations (200+ users)	Annual contract	Custom on-boarding, SLA, dedicated support

Business Incentives

The product will operate as a **B2B SaaS product**, offered to catering-dependent organizations (corporate offices, institutions, factories) on a monthly or annual subscription basis. Businesses pay a recurring fee to use the platform, with pricing based on how large their organization is and which features they need. For the businesses using it, the benefit is straightforward — they stop wasting time on paperwork, avoid stock running out unexpectedly, and always have a clear picture of their daily operations. For Betopia, once the platform is built, the cost of serving each new client is minimal, meaning profit grows as more organizations subscribe.

Value to the Subscribing Business:

- No more paperwork: Orders, payments, and stock levels are all recorded digitally in real time — nothing is written down or compiled by hand.
- Inventory stays under control: Stock is tracked automatically per portion, so items never run out mid-service without warning.
- Faster end-of-day reviews: Instead of manually pulling together daily records, everything is already logged and viewable instantly from the dashboard.
- Clear cash records: Every transaction is saved against its order, so there is never any ambiguity over how much was collected or returned.
- Better staff coordination: Kitchen Staff receive orders directly through the system, removing the need for verbal handoffs or manual order.

Value to Betopia Limited:

- Low marginal cost: Once developed, serving additional clients requires no proportional increase in development cost.
- Recurring revenue: Subscription model ensures predictable

	monthly/annual income vs. one-time project fees.	
	• Scalability: The same code-base serves all clients; infrastructure scales with demand. • Up sell pathway: Clients on Starter tiers naturally grow into Professional or Enterprise as their operations expand.	
Project Scope		
In Scope	• User registration, login, and role-based access for Admins, Kitchen Staff, and Users. • Menu management including item creation, pricing, availability, and category assignment. • On-demand meal ordering with real-time order queue. • Order status management (Pending → Preparing → Ready → Served / Pending → Canceled). • Cash transaction recording per order, including amount tendered and change returned. • Portion-based inventory tracking with low-stock alerts and auto-disable at zero stock. • Admin dashboard with daily order summaries & revenue records.	
Out of Scope	• Digital wallet, prepaid balance, or any online payment method for proper payment processing. • Multi-branch or multi-location catering operations. • Third-party payment gateway or external banking integration. • Native mobile application (iOS / Android). • Integration with external systems such as HR, ERP, or accounting tools. • Advanced analytic, forecasting, or AI-driven insights.	
Project Stakeholders		
	Stakeholder	Role
	Admin	Manages users, menu, inventory, and oversees all daily catering operations.
	Kitchen Staff	Processes incoming orders, manages item availability, and logs stock usage.
	User	Browses the menu, places on-demand orders, and completes cash transactions at the counter.
	Product Team	Responsible for defining requirements, design decisions, and overall delivery of the platform.
	Developer Team	Responsible for building, testing, and deploying the system based on defined requirements.

Requirements

Business Requirements

BR-01: Centralized Catering Operations

The system must provide a single platform that manages the full catering workflow of ordering, payment, and inventory, eliminating the need for any parallel paper-based process.

BR-02: Role-Based Operational Control

The system must ensure that Admins, Kitchen Staff, and Employees each operate within clearly defined boundaries, with access and capabilities appropriate to their role.

BR-03: Real-Time Order Visibility

Both staff and admins must have visibility into orders as they happen, removing the communication gap that exists in a manual setup.

BR-04: Inventory Accountability

The system must maintain a live record of stock levels on a per-portion basis, ensuring that inventory status is always known and that stock depletion directly affects menu availability without manual intervention.

BR-05: Operational Record Keeping

The system must automatically maintain records of all orders, payments, and stock usage: making end-of-day and end-of-month reviews a matter of viewing data, not compiling it.

BR-06: Scalability of User Base

The system must support the addition of new employees without operational disruption, allowing the catering service to grow without adding administrative overhead.

Functional Requirements

FR-01: Authentication

The system must support user registration, login, password reset, and secure logout for all users across all roles.

FR-02: User Management

Admins must be able to create, edit, deactivate, and assign roles to user accounts.

FR-03: Menu Management

Admins must be able to create, edit, and remove menu items, each with a name, price, category, and availability status. Kitchen Staff must be able to manually mark items as unavailable at any time.

FR-04: Automatic Menu Availability Control

The system must automatically disable a menu item when its stock quantity reaches zero, and require explicit manual re-enabling by Kitchen Staff after restock confirmation.

FR-05: On-Demand Ordering

Users must be able to browse available menu items and place on-demand orders in real time.

FR-06: Order Queue & Status Management

Kitchen Staff must have access to a live order queue and must be able to update order status through the flow: Pending → Preparing → Ready → Served / Canceled.

FR-07: Cash Transaction Recording

Each order must record the cash amount tendered by the User and calculate the change to be returned, with the full transaction saved against the order record.

FR-08: Inventory Tracking

Admins must be able to set and update stock quantities per menu item, with the system decrementing stock in real time as orders are placed.

FR-09: Admin Dashboard & Reporting

Admins must have access to a dashboard displaying daily order summaries, cash revenue totals, and top ordered items, with order and transaction records filterable by date.

FR-10: Access Control

The system must enforce role-based access control for Admins, Kitchen Staff, and Users, ensuring each role operates strictly within its permitted scope. All access restrictions must be enforced server-side on every request.

Non-Functional Requirements**NFR-01: Performance**

The system must load all core pages and process order placements within 3 seconds under normal operating conditions.

NFR-02: Reliability

The system must be available during operational hours with minimal downtime, ensuring no interruption to active catering service.

NFR-03: Security

All user passwords must be encrypted. Access to each role's functionality must be enforced server-side, not just on the front-end.

NFR-04: Usability

The interface must be simple enough for Kitchen Staff and Users to operate without formal training or a manual.

NFR-05: Scalability

The system must support a growing number of users and daily orders without requiring architectural changes.

NFR-06: Data Integrity

Order records, cash transactions, and stock levels must remain accurate and consistent at all times, with no data loss on system errors.

Project Constraints

Assumptions

- All users (Admins, Kitchen Staff, and Users) will have access to a stable internet connection during operational hours.
- Kitchen Staff will consistently update order statuses and stock levels in real time as part of their workflow.
- Admins will be responsible for on-boarding users and maintaining accurate stock quantities in the system.
- Menu items and pricing will be set up by the Admin prior to the start of each service period.

Constraints

- The platform must be delivered within the defined Phase 1 scope, with no mid-development additions to core functionality.
- The system will be web-based only, with no native mobile support in Phase 1.
- Cash handling and physical top-up processes remain outside the system's control and depend on internal organizational discipline.
- The platform will be built and maintained by a student development team, meaning available development hours and resources are limited.

Risk Assessment

	Risk	Likelihood	Impact	Mitigation
	Staff resistance to adopting the digital system	Medium	High	Conduct an internal walk-through session with Kitchen Staff and Admins before launch
	Inaccurate stock data entry by Kitchen Staff	Medium	High	Admin audit trail with daily stock review to catch discrepancies early
	Internet downtime during operational hours	Low	High	Define and document a fallback manual process to be used during outages
	Low user adoption in early weeks	Medium	Medium	Admin-led on-boarding for all Users before go-live
	Order status not updated in real time by Staff	Medium	Medium	Establish clear operational guidelines for Kitchen Staff on system usage during service

Success Metrics

Paper Process Elimination

Percentage of orders placed and recorded through the platform vs. Manually. Our target: 100% digital within 30 days of go-live.

Admin Review Time Reduction

Reduction in time spent compiling end-of-day and end-of-month operational reports. Our target: 70% reduction vs. pre-system baseline.

Inventory Accuracy Rate

Percentage of end-of-day stock counts matching system records. Our target: $\geq 95\%$ accuracy, measured via Admin audit trail.

User Adoption Rate

Percentage of registered employees actively placing orders through the platform within the first 4 weeks of launch.

Order Processing Speed

Average time from order placement to Kitchen Staff acknowledgment (status change to Preparing). Our target: status update under 2 minutes.
